## Photoshop CC 2019 Version 20 PC/Windows (Updated 2022)

A word of caution: Editing is a highly technical job. You can make mistakes that may be obvious to you but disastrous to your digital image. As a beginner, the following list of tips can help you improve the quality of your finished images and prevent some of the common mistakes that beginners make. These tips work for both digital and film photography. Images that look too dark or too light When you're in the midst of taking a photograph or making an adjustment to an image, it's easy to forget that the image has been enlarged and reduced in size. It's a good idea to magnify your image before making any adjustments (see Figure 6-3). Because the image has been magnified, small things, like a scratch on the camera lens, tiny details, and so on, appear very large. It's very easy to make a mistake when you're working on a small image because everything appears much bigger. The solution is to simply magnify the image or make it larger before you make your adjustments. The image shown in Figure 6-3 was magnified 10 times. **Figure 6-3:** Magnifying your image can help you identify small details that may otherwise be easy to overlook. Adjusting the brightness and contrast Doing any adjustment to a photo with some gray in it can make the other colors in the image look oversaturated or underexposed. For example, when you use an image-editing program to adjust the brightness or contrast, make sure that you leave some of the gray in the photo. This way, you can correct the other colors in the image without changing their appearance. Many of the most popular adjustment tools in Photoshop are found in the Adjustments/Levels window, as shown in Figure 6-4. Adjustments/Levels is usually automatically selected by default. To access the window, choose Window⇒Levels or press L. **Figure 6-4:** Adjustments/Levels has several tools to help with color and exposure adjustments. Selecting a color Often when you adjust an image, you apply a color adjustment. Color adjustments affect the colors in the image and can adjust brightness, contrast, and saturation. When you use a color adjustment, make sure that the adjustment doesn't result in a change of color or a change in the size of any color range. Adjusting color requires a little practice. Consider the image shown in Figure 6-

Autophagy of *Acinetobacter baumannii* induced by propolis shows similar morphological aspects to autophagy of enterohemorrhagic *Escherichia coli* O157:H7. Autophagy plays a key role in maintaining cellular homeostasis and protecting the cells from infection. In this study, we investigated the effect of propolis, a natural product from honeybee hives, on the cytotoxicity and induction of autophagy in *Acinetobacter baumannii*. *Acinetobacter baumannii* showed a cytoprotective effect against antimicrobial peptides, and propolis was shown to induce apoptosis in *A. baumannii*. However, *A. baumannii*-derived vacuoles, which were induced by propolis or not, were highly similar to autophagosomes in size and shape. Moreover, this vacuolation was increased by the addition of 3-MA, a specific inhibitor of autophagy, and this increase was diminished by the presence of bafilomycin, an inhibitor of autophagosome-lysosome fusion. An in vitro co-culture study demonstrated that propolis inhibits the growth of *A. baumannii* with the simultaneous induction of autophagy in epithelial cells. These results indicate that propolis might induce autophagy in *A. baumannii*, similar to apoptosis. Moreover, the specific induction of autophagy against *A. baumannii* might explain the difference of sensitivity of this bacterium to propolis in an in vitro co-culture study.
